

# Premium Gap Analysis

Detailed health and risk reporting, with concrete recommendations on how to get to a healthy, secure IT environment

## Problem Statement

Organisations are hindered from providing an efficient, secure infrastructure environment by a few key issues:

- **Lack of visibility** across the estate
- **Lack of cross functional work** between security & IT
- **Inadequate tools** to manage a distributed workforce

With employees leaving the office, and staying out of it, this problem has been never been more in focus.

## Premium Gap Analysis

The premium gap analysis, carried out by EndpointX, provides firsthand experience from many of the worlds best run institutions, combined with the power of the Tanium platform, to provide:

- **Actionable insight** into the IT risk, IT health and IT security of the whole estate
- **Data driven recommendations** on how to improve the situation
- **Independent implementation** of the work with little to no impact on an already busy workforce

## Key Focus

The key metrics at the focus of the premium gap analysis are:

- **Cyber Risk**
  - What type of vulnerabilities are there across the estate and how dangerous are they?
  - Where are the most vulnerable locations, business units, and configurations?
  - What are the most important resolution actions to take to resolve these vulnerabilities?
- **IT Hygiene**
  - What is the patch coverage across workstations and servers?
  - How up to date is installed software, and is there anything unwanted or dangerous?
  - Is there any Personal Identifiable Information in the estate that could be at risk?
- **Visibility**
  - Is there anything on the network that isn't known about?
  - How good is your CMDB vs real time observations on the network?

## The Program

In **5 weeks**, EndpointX will deploy Tanium and its agent, and will provide an overview of the results obtained, with key recommendations on how to resolve the issues highlighted covering:

- How to mitigate and resolve the most important open risks & vulnerabilities
- Top 10 pieces of software to target to bring software configuration in line
- A “path to good” for OS patching on servers and workstations
- A visibility view of the estate & path to 100% management
